INTRODUCTION

- Lung cancer screening enables earlier detection and has the potential to improve outcomes.
- In India, lung cancer screening is not yet systematically implemented at a national level.
- Awareness and participation in lung cancer screening remain limited, particularly among individuals who have never been screened.
- We evaluated a “Conference-as-Catalyst” model integrating an ongoing screening program with a national oncology forum to amplify awareness and increase screening participation.

METHODS

DISCUSSION AND CONCLUSION

- ◆ **Screening Gap** - 95.5% never previously screened
- ◆ **Beyond smoking** – 39.6% were non-smokers
- ◆ **Screening yield**–67 high-risk + 86 intermediate-risk nodules
- ◆ **Awareness** → **Action** - ~50% increase in screening volume
- ◆ **Scalability** - Links awareness, advocacy and screening infrastructure

CONCLUSION

“From Conference to Catalyst: Turning Awareness into Screening Action.”

A national oncology forum, integrated with an existing lung cancer screening pathway, was associated with a ~50% increase in screening volume – demonstrating the potential of awareness amplification to move lung cancer screening from discussion to action in India.

REFERENCES & ACKNOWLEDGEMENTS

ACKNOWLEDGEMENTS

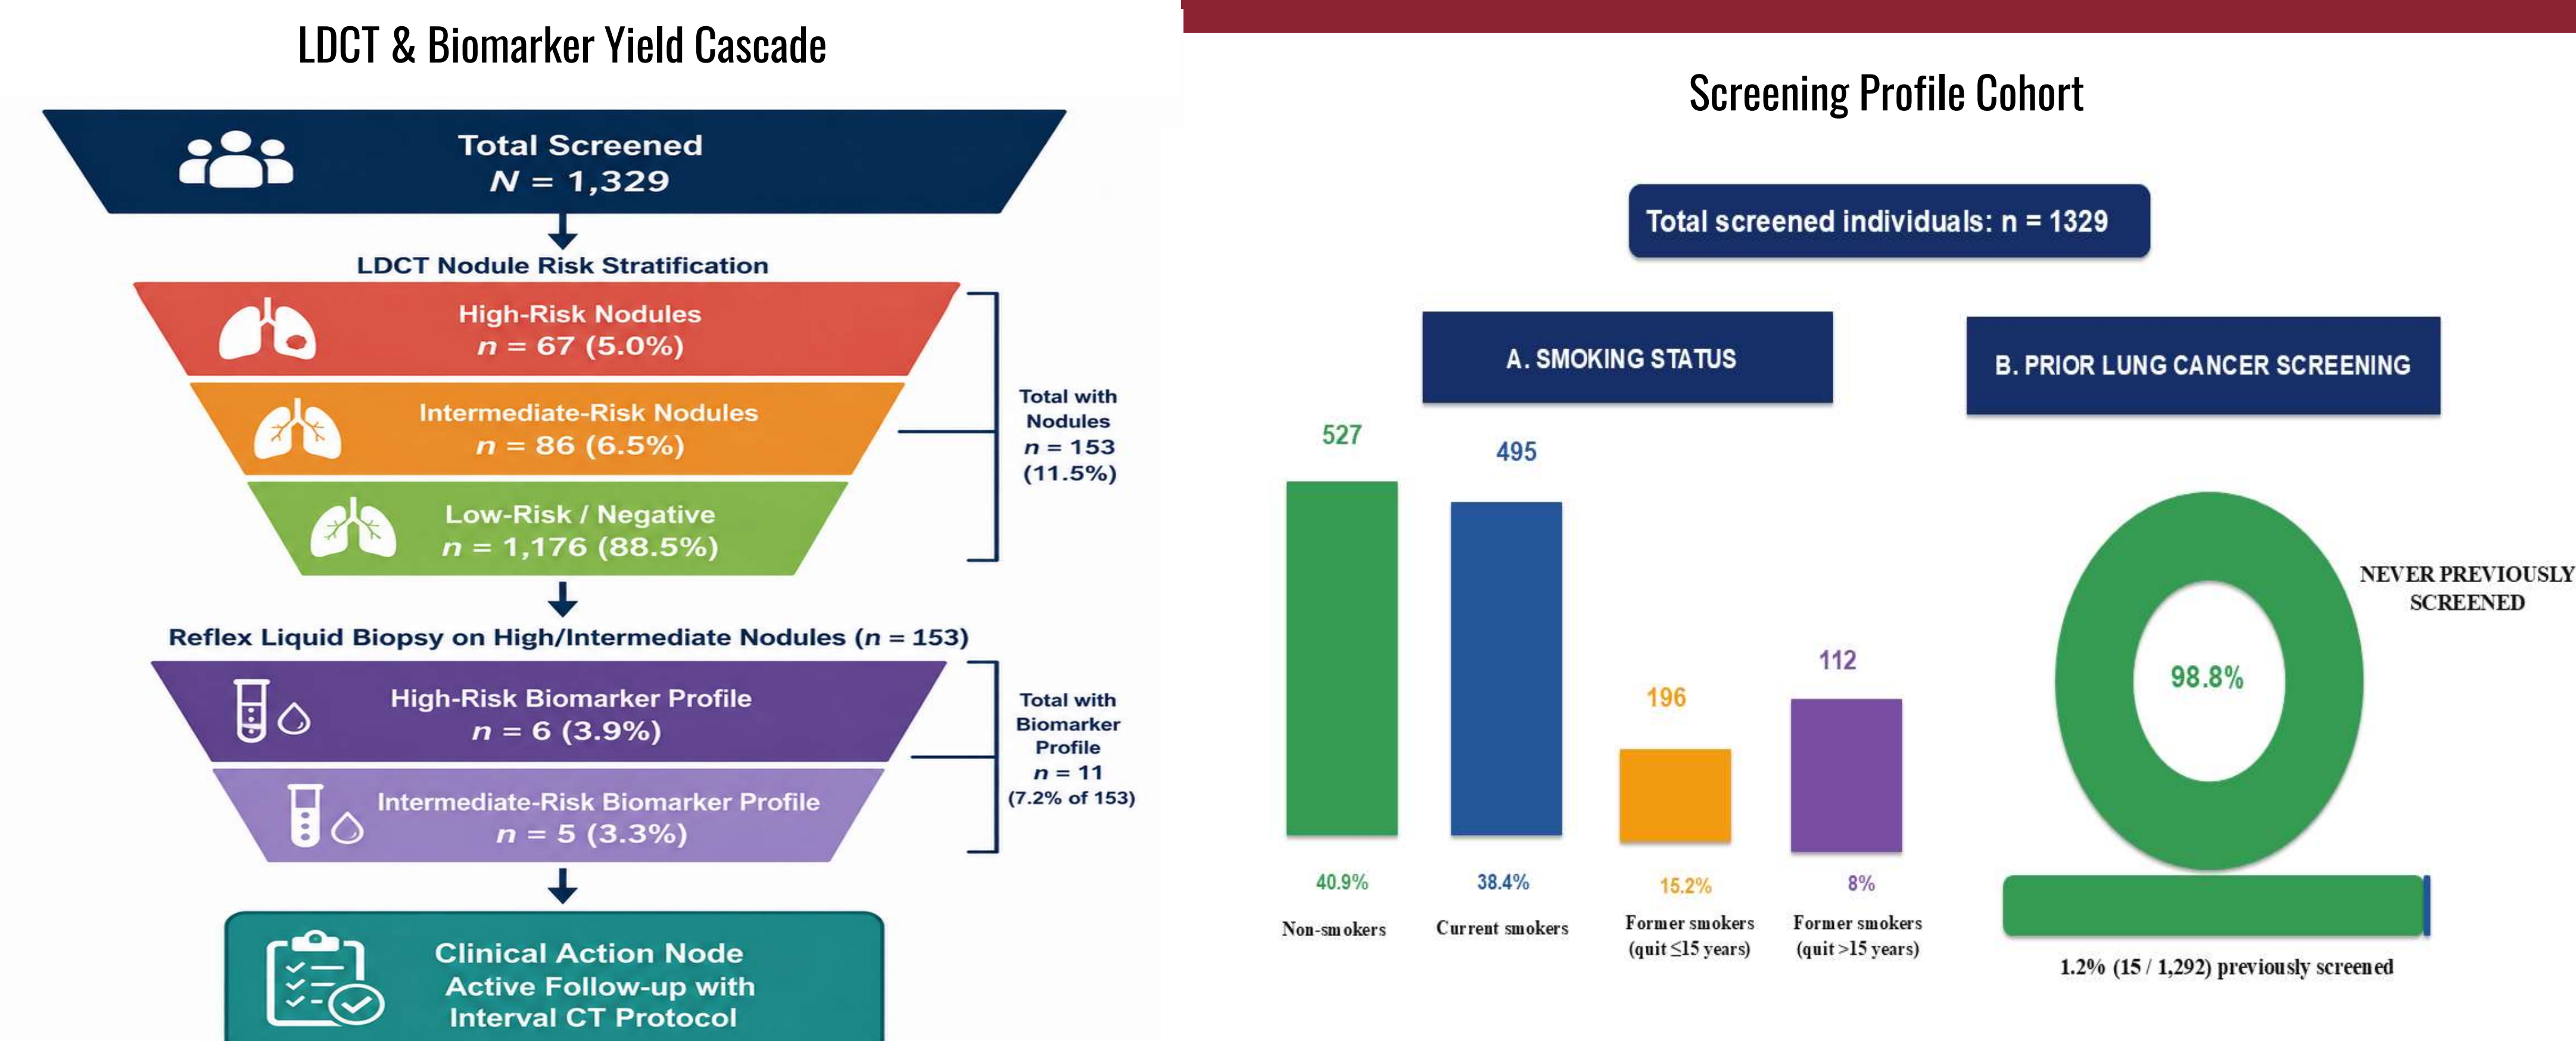

We acknowledge APCLC, LCPN Network, Lung Connect India Foundation, patient advocates, celebrity ambassadors, media partners and multidisciplinary faculty who contributed to illuminate Oncology Townhall 3.0

We acknowledge all team members who are involved in this screening initiative.
